Águas de Cascais

Who we are

Since 2001, AdC - Águas de Cascais, S.A., has been the concessionaire of the Cascais Municipal Water Distribution and Sewage Drainage System

119.154 Customers

107.084 domestic customers

10.669 non domestic customers

1.401 municipality costumers

Certified in standards

NP EN ISO 9001:2015

NP EN ISO 14001:2015

NP ISO 45001:2019

Águas de Cascais

Concession Contract

Clause 9th

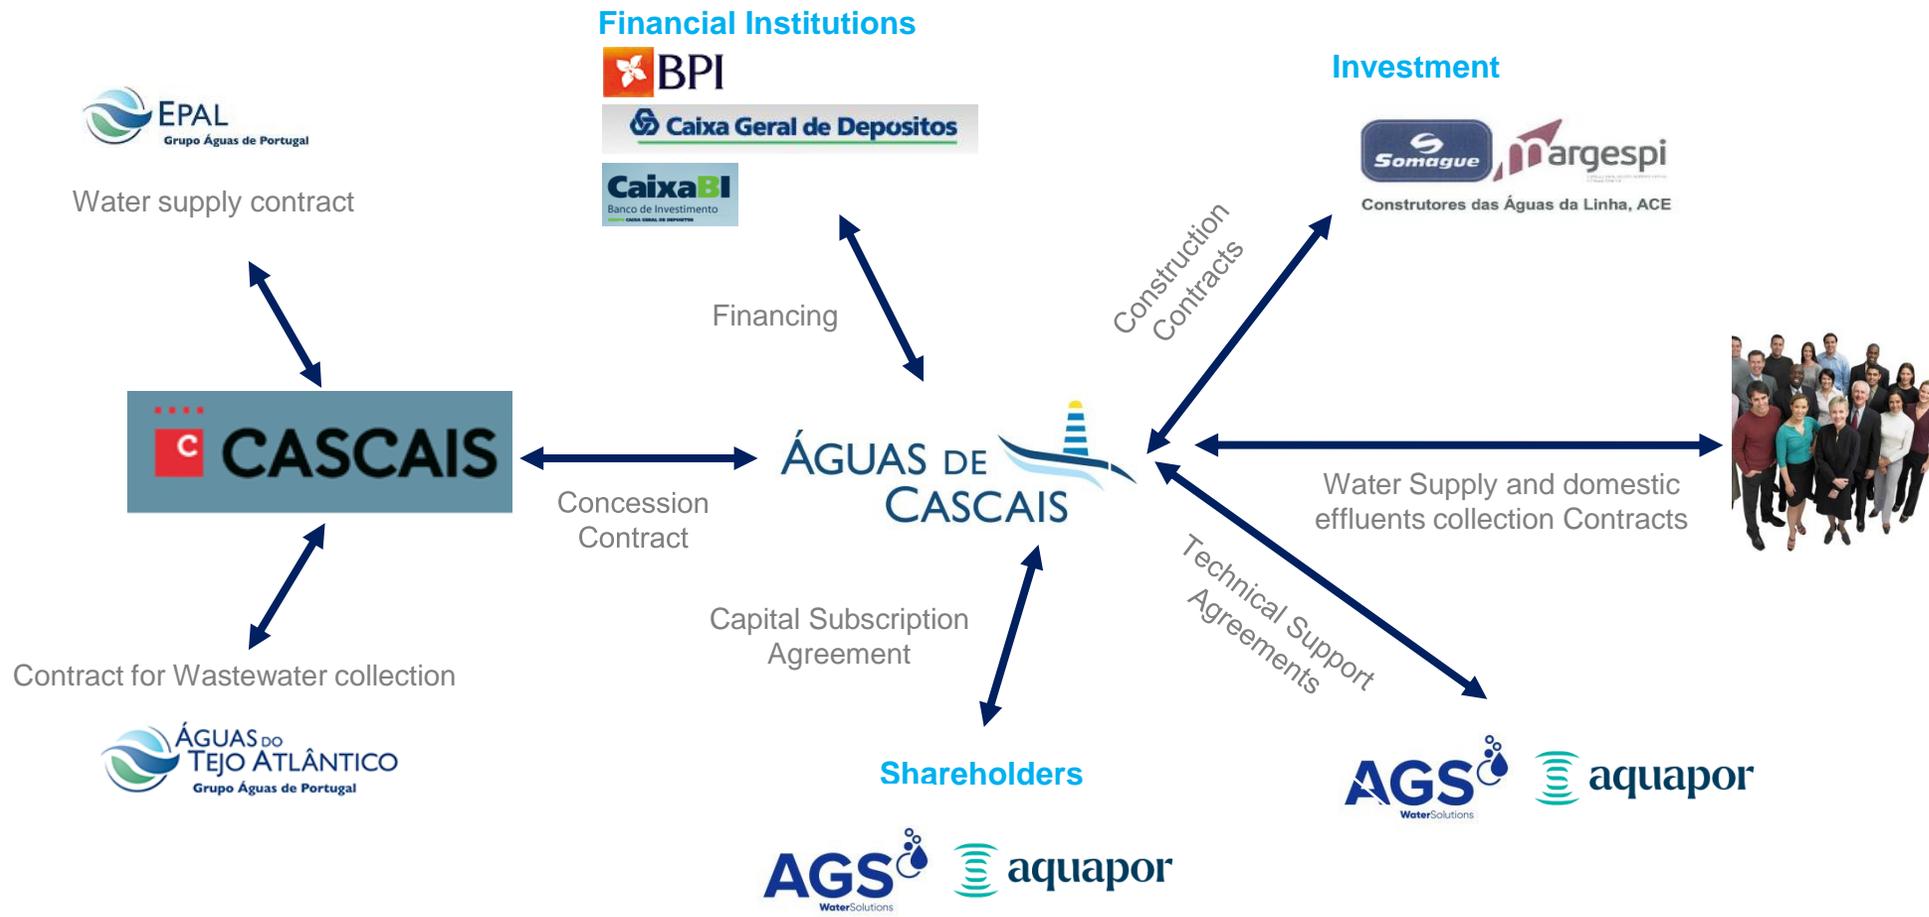

Purpose

*The purpose of the Concession is the Joint Exploration and Management of the **Maintenance of the Rainwater System**, and the Joint Exploration and **Management of municipal public services for the catchment, treatment and distribution of water for public consumption and the collection and rejection of domestic effluents** in the perimeter as defined in Clause 13 (Cascais Municipality), including the **construction, extension, repair, renovation, maintenance, and improvement of all Facilities, Infrastructures and Equipment** that make up the Water Supply and Sewage Systems, as well as all Works, In accordance with the Investment Plan, the Base Case and the Exploration Program.*

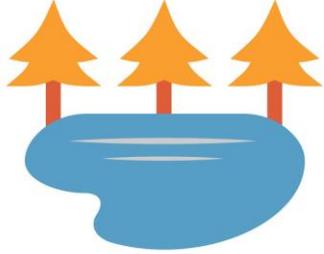

Águas de Cascais

Water Supply System

16 Own water sources:
- 15 ground water
- 1 surface water (Albufeira Rio da Mula)

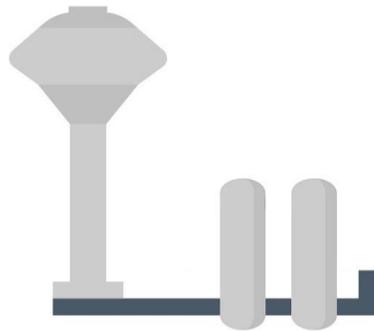

2 Water Treatment Plants (WTP)

25 Water Reservoirs (91.000 m³)

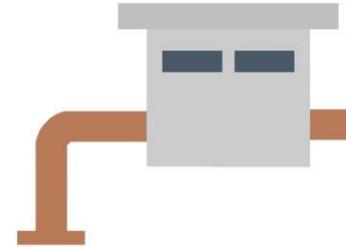

1.421 km Water Supply Network

24 Water supply pumping stations

Wastewater Drainage System

22 Domestic sewage pumping stations

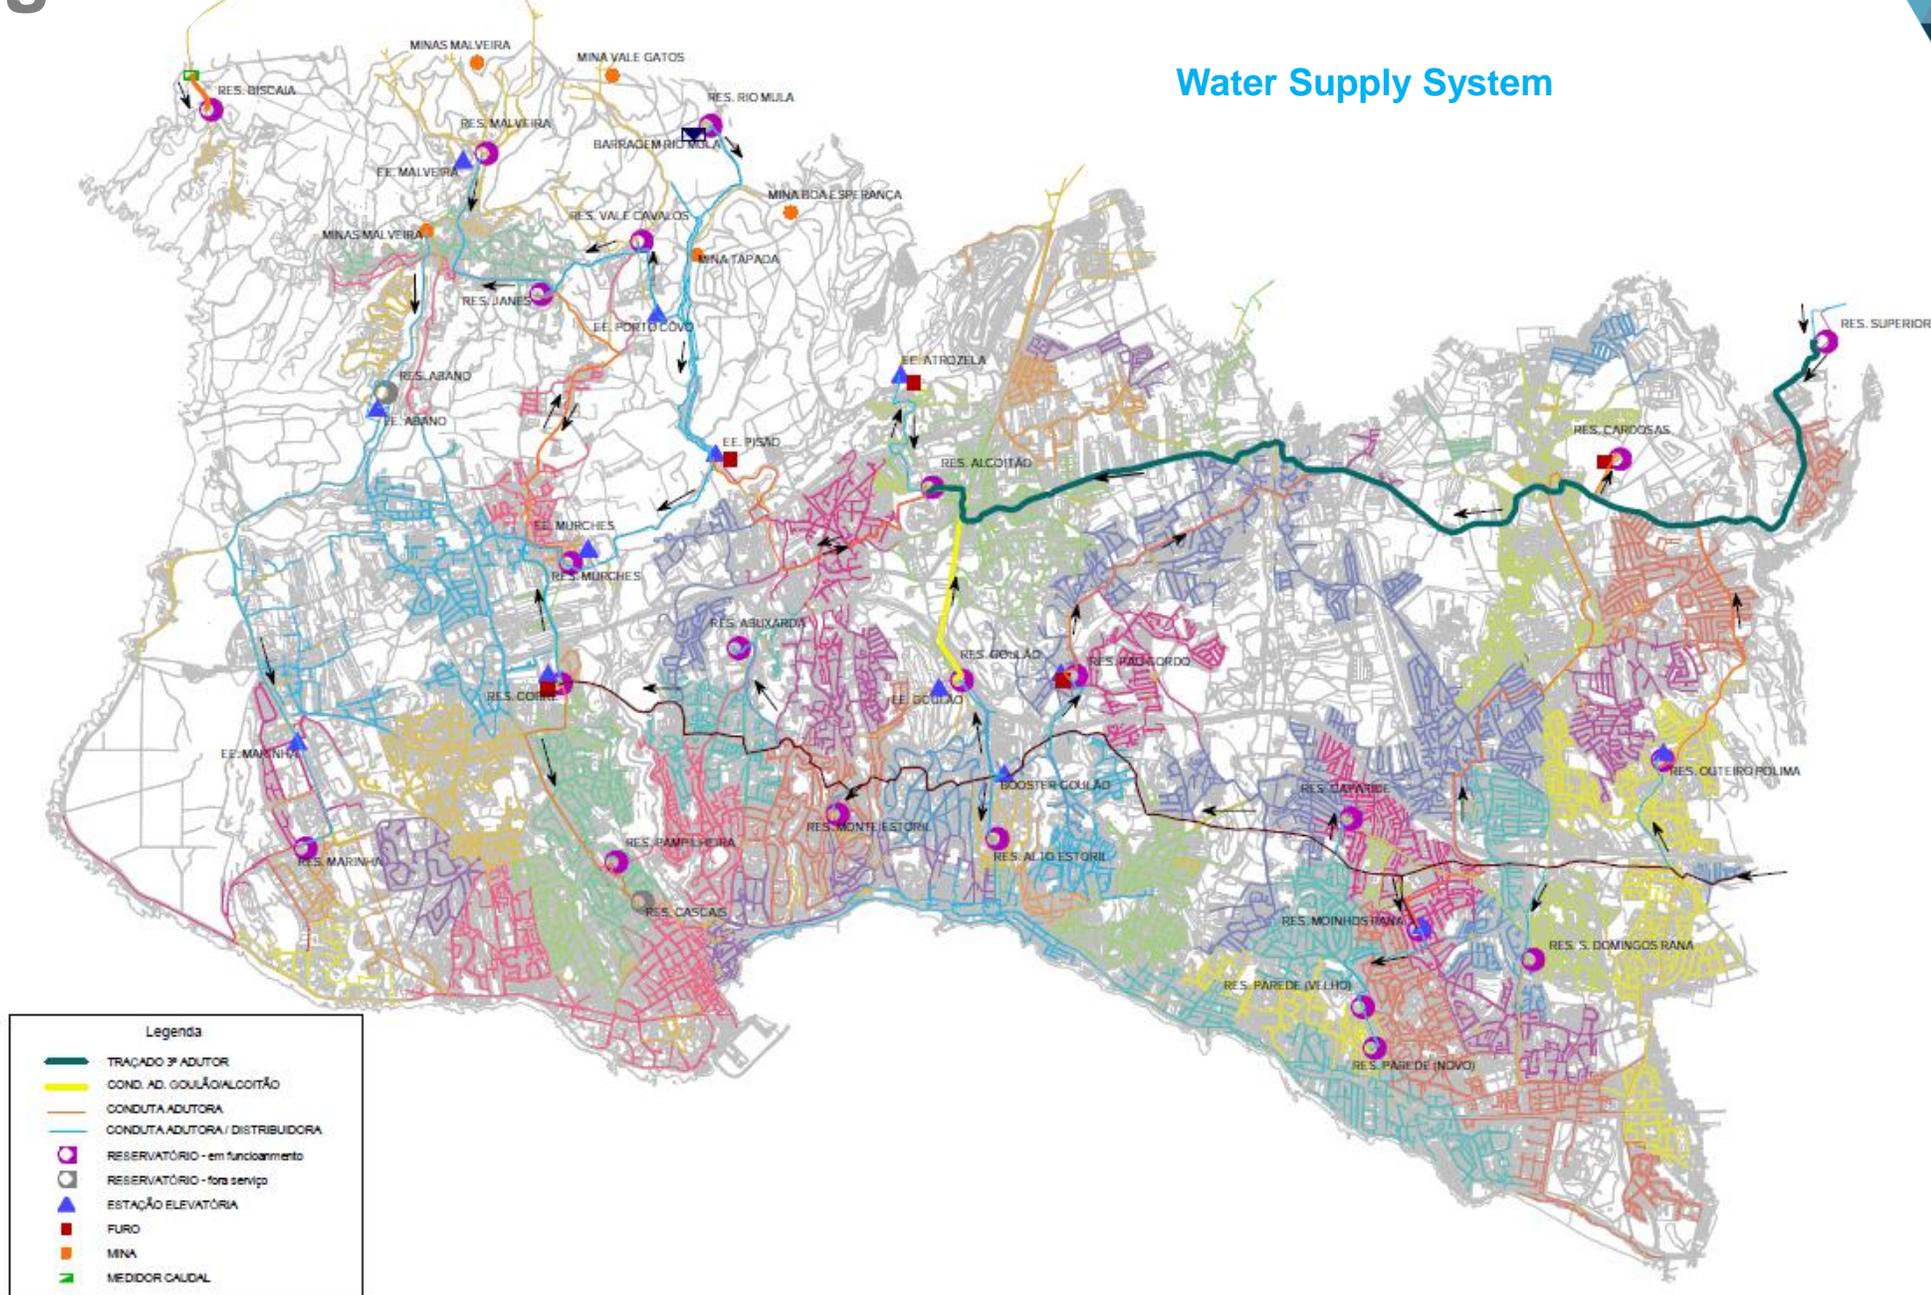

789 km Gravity sewage pipes

WATER LOSS MANAGEMENT

NRW

Source: RASARP 2022 (Vol. 1) – Geographical Distribution of the NRW Indicator for the water distribution service

WATER LOSS MANAGEMENT

Motivation

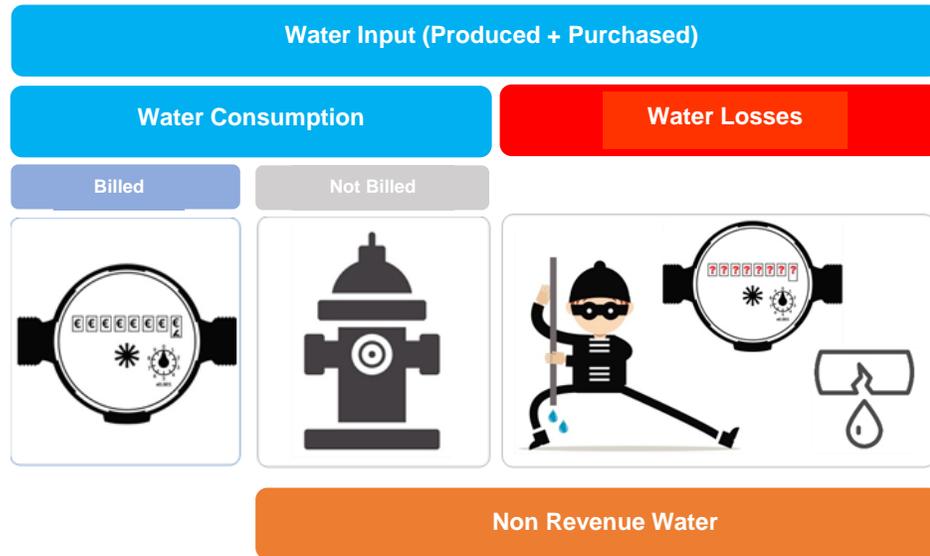

- ✓ Improvement of efficiency in the management of the water supply system (improvement of environmental and economic sustainability)
- ✓ Reduction in operating costs (AdC buys 85% to 90% of the water it distributes) and investment costs
- ✓ Improvement in water metering and billing processes
- ✓ Reducing damage to third-party infrastructure
- ✓ Reduction of inflows to drainage systems (domestic and rainwater), resulting from losses in the supply system
- ✓ Renovation of the water supply network
- ✓ Improved quality of customer service
- ✓ Promote user awareness for issues related to the scarcity of the water resource

WATER LOSS MANAGEMENT

Overall Strategy

Hydric balance

Actions to reduce apparent losses

- ✓ Illicit use of water
- ✓ Flowmeter measurement errors

Actions for active control of real losses

- ✓ Active leak research
- ✓ Fast and effective location and repair of leaks
- ✓ Remodelling of the water network
- ✓ Pressure management

Actions to improve the billing process

- ✓ Reading itineraries
- ✓ Readings
- ✓ Invoicing

WATER LOSS MANAGEMENT

Main Tools and Applications

WATER LOSS MANAGEMENT

Billing Process

Reading itineraries

- ✓ Optimization of the billing process, minimizing unread locations, and considering reading dates, billing periods and the geographical proximity between the locations of consumption
- ✓ Periodic billing of consumption, resulting from cycle readings, foreseen in the zones/areas calendar
- ✓ More accurate invoicing, close to the actual volumes consumed
- ✓ Identification of abnormal situations, as illicit (damaged flowmeters, direct connections), stopped flowmeters, bursts in the building private network or public road
- ✓ Periodic review to adjust to the increase in the number of locations to be read, to keep the reader's daily work adequate

Readings

- ✓ The itineraries are established in such a way that each reader visits the same place of consumption every two months
- ✓ Team of 8 readers and 1 supervisor for approximately 119,000 customers
- ✓ Each reader visits an average of 310 consumption places per day

Invoicing

- ✓ Daily invoicing and automated process with automatic integration of readings

WATER LOSS MANAGEMENT

Reduction of Apparent Losses

Illicit use of water – Planning

- ✓ Videoscope campaigns (about 90 days a year)
- ✓ Simple inspection
- ✓ Selection of sites to inspect

WATER LOSS MANAGEMENT

Reduction of Real Losses

Fast and effective location and repair of leaks

Teams with the mission of moving very quickly to the location and, after assessing, proceeding to interrupt the loss with the least possible impact on supply.

| | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
|--------------------------------------|---------|---------|---------|---------|---------|---------|
| Average Time to close (min) | 40:45 | 43:51 | 43:04 | 44:32 | 49:59 | 52:25 |
| Average Interruption Time (hh:mm:ss) | 3:42:37 | 3:52:01 | 3:52:44 | 3:31:48 | 3:51:25 | 4:15:38 |

The registration of service orders is carried out in real time and directly in the GIS.

Consulting the service orders in the GIS makes it possible to understand the course of the intervention from the beginning to the closure, characterize the locations, manage the information in the customer system, optimize the closing of valves, etc.

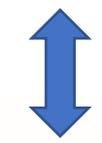

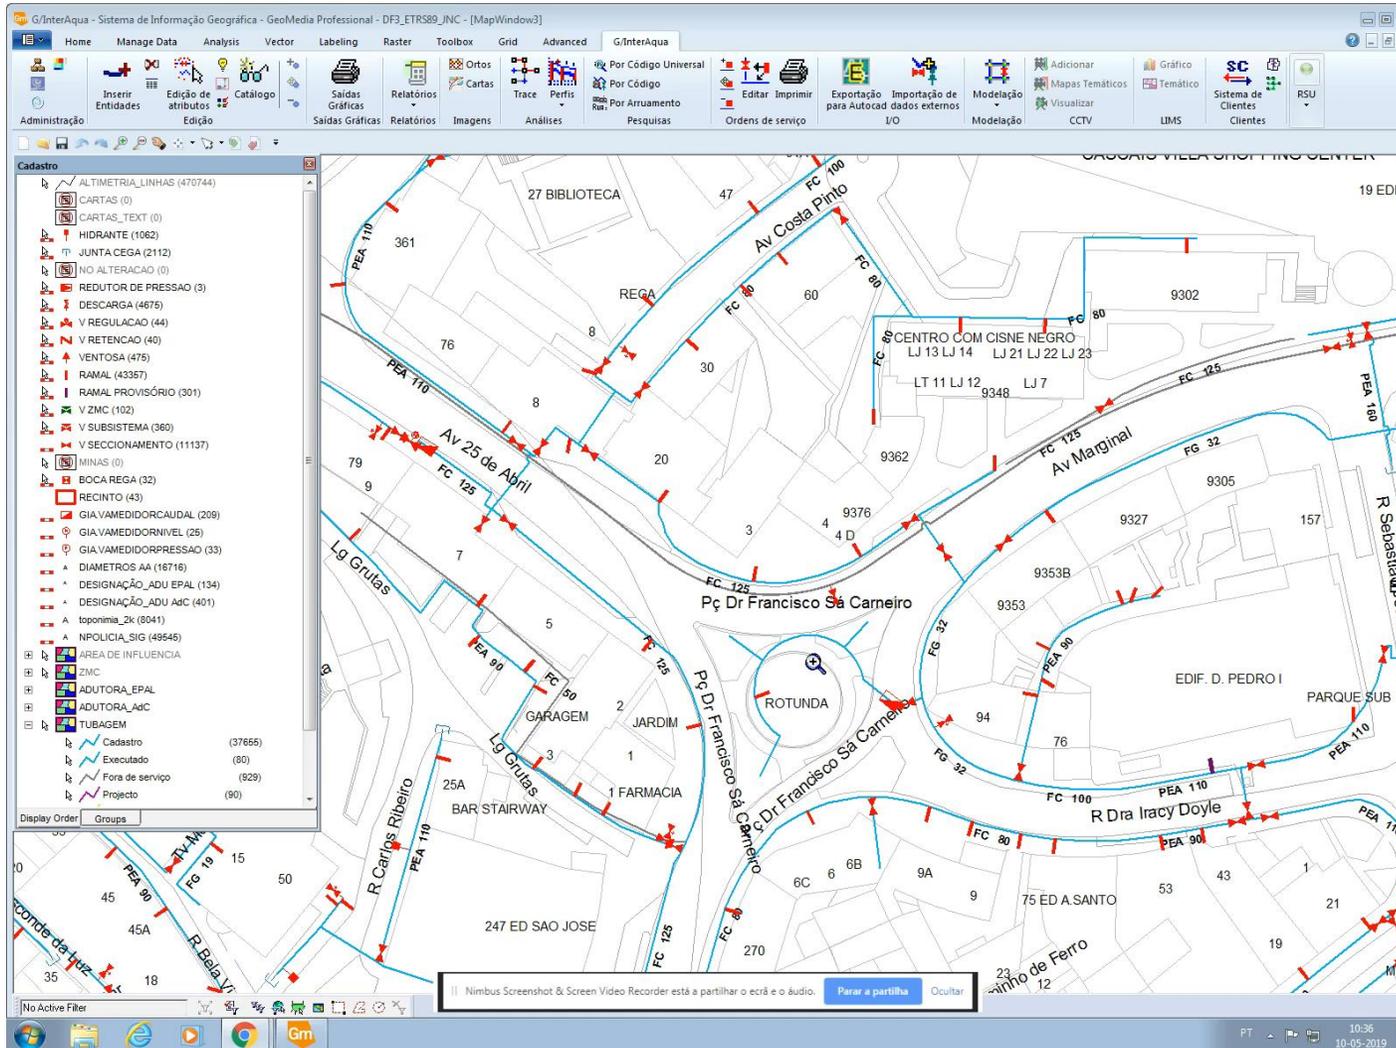

WATER LOSS MANAGEMENT

Reduction of Real Losses

Network Analysis

Traditional Analysis vs Hydraulic Analysis

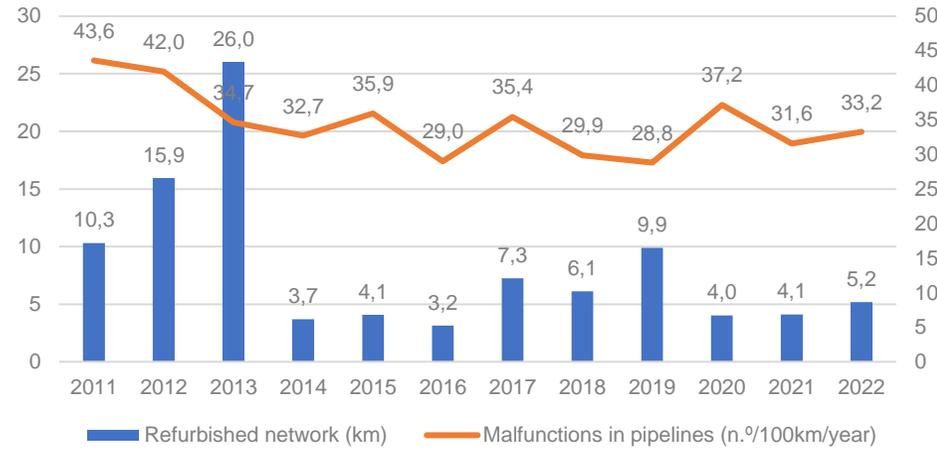

WATER LOSS MANAGEMENT

Reduction of Real Losses

Renewal of the water network

Probably the most effective action in reducing water loss (it eliminates silent leaks or Background Leaks and reduces bursts).

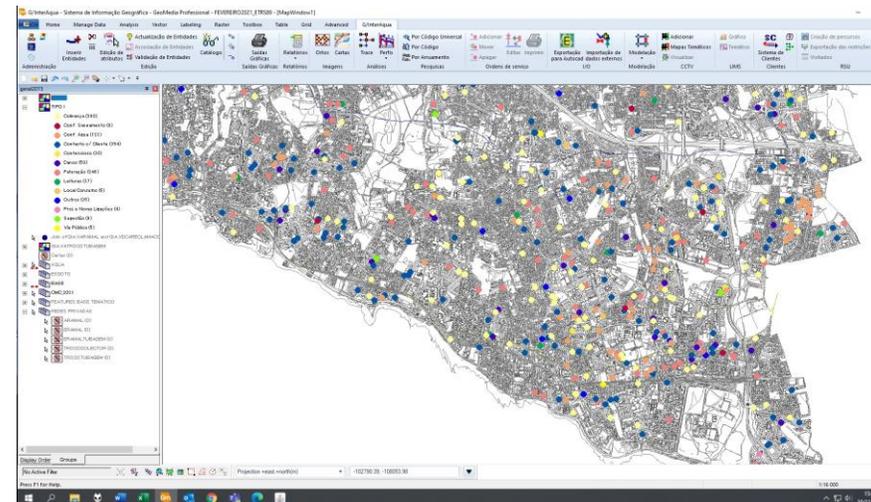

Carried out following an economic and risk assessment.

| Localidade | N.º | Rua | Diâmetro (mm) | Remodelação Extensão (ml) | Prev. Roturas/Ano | Custo Ano Oportunidade | Inv. Pr. Correntes | Inv. Pr. 11/1999 | Payback (# anos) | Risco (1 a 25) |
|------------|-----|-----------|---------------|---------------------------|-------------------|------------------------|--------------------|------------------|------------------|----------------|
| AREIA | 696 | S Braz,Lg | 100 | 151 | 2 | 1.155 € | 14.703 € | 10.002 € | 12 | 16 |

Complaints Management

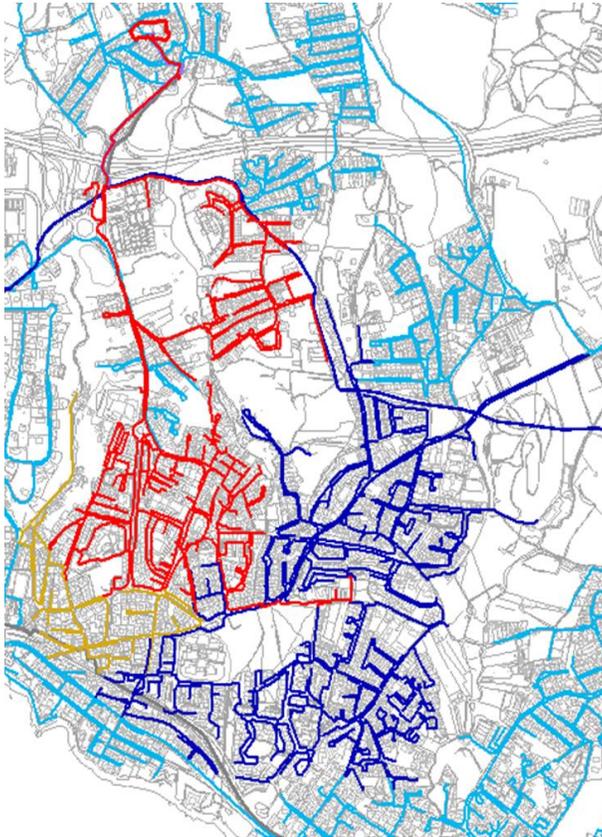

- ✓ Integration between data from the Commercial Department and representation in the GIS
- ✓ Geographic representation of complaints in detail and by type of complaint (example: water quality, pressure, among others)
- ✓ Identification of the geographic incidence of complaints

WATER LOSS MANAGEMENT

Reduction of Real Losses

Pressure management

Description

- Three Measuring and Control Area (MCA) - PG1.1, PG1.2 and PG1.3
- 2 Flowmeters
- 2 Pressure Reducing Valves
- Expansion of water distribution network and installation of 10 sectioning valves

Works developed

- Pressure reduction of 10 metres water column (phased and above regulatory minimums)
- Monitoring of pressures along the MCA (Data Base)
- Leak Log (data analysis)
- Survey of atypical behaviours / consumption (washes, fire use, hotel maintenance (reservoirs, swimming pools), watering (municipality))

Main Results

- An average pressure reduction of around 17% (mean reduction of 10 mwc) resulted in a reduction of about 16% in the minimum overnight flow.
- This reduction also resulted in a 42% reduction in the number of leaks in the project area

Final Notes

- ✓ Importance of a proactive approach to managing water losses
- ✓ Creation of integrated dynamics between the various areas of the company
- ✓ Increased knowledge of water supply systems
- ✓ Overall improvement in the efficiency of water supply systems
- ✓ Contribution to improving the resilience of water supply systems
- ✓ Mitigation of water scarcity and reduction of pressure on storage, collection and treatment systems for water supply
- ✓ Making investments, p. e.g., in the renewal of networks, replacement of meters, installation of VRP for pressure management, acquisition of computer applications or training of human resources
- ✓ Importance of having competent, motivated, coordinated and objective-focused teams

Thank you for your attention!
